

Tech Pack Template

A tech pack is the document a factory prices and cuts from: the style, its materials, every measurement, every seam and every label. Download our template, fill in what you know, delete what you don't, and send it with your inquiry.

Free, no email required. The Excel file has seven sheets to fill in; the PDF is the same structure, for printing or marking up by hand.

Cover — the style, identified

One page that lets the factory file your style, quote it and find the right version later. Keep the style number on every document from here on.

Field	What to put in it	Example
Style number	Your internal code for the style. It becomes the reference on samples, invoices and cartons.	HLN-2401-HOOD
Style name and category	What the product is in plain words, so the sample room can sort it by line.	Oversized hoodie, unisex
Season and delivery window	When the goods must reach your warehouse — this drives fabric booking and the shipping mode.	FW26, in store by August
Brand and contact	Who the factory quotes, who approves samples, and where samples ship.	brand@example.com
Target quantity	Pieces by colour and size, or the range you are deciding between. This is what makes a quote real.	300 pieces, 3 colours
Version and date	Which revision this is and what changed. Factories quote the version they were sent.	v3, 12 May 2026
Target retail price	The price point you are designing to — optional, but it helps the factory propose the right fabric and construction.	US\$79

Sketch — what it looks like

Pictures remove more misunderstandings than any paragraph. A flat drawing, a marked-up photo or a physical reference all work; the notes around them are what make them useful.

Field	What to put in it	Example
Front view	A flat sketch, a clean photo or a marked-up screenshot. Mark seams, pockets, closures and panel breaks.	flat-front.png
Back view	Same treatment. Note any back print, yoke seam or panel split.	flat-back.png
Numbered callouts	Number every detail on the sketch; explain each number once on the Construction sheet.	1: lined hood
Reference garments	Photos of a product you own, with what to copy and what to change. Often faster than a drawing.	Fits like this, 4 cm longer
Point-of-measure lines	Optional lines showing where each measurement is taken, keyed to the Measurements sheet.	A, B, C

BOM — every material, line by line

The bill of materials is where price is made. List each part separately — body fabric, rib, trims, labels, packaging — with the columns below. Consumption per piece and colour references are what let a mill quote the same thing twice.

Field	What to put in it	Example
Part	Where the material goes: body, hood, cuffs, pocket lining, drawcord.	Body
Material	The trade name, so the factory can propose an equivalent if yours is unavailable.	French terry

Field	What to put in it	Example
Composition	Fibre percentages. Drives price, hand feel and most of the duty rate.	80% cotton / 20% polyester
Weight	Grams per square metre — convert your oz/yd ² figures first.	320 GSM
Colour	A Pantone reference or “match to swatch”. Note where the body and trims differ.	Pantone 19-4024 TPX
Supplier or reference	Your supplier, an existing fabric code or a physical swatch you will courier.	swatch sent 12 May
Consumption	Metres or kilograms per piece including wastage. We verify it, but a starting figure speeds up costing.	1.4 m per piece
Notes	Finish, shrinkage, stretch direction, test requirements, minimum per colour.	Enzyme wash, max 5% shrinkage

Measurements — the size set, point by point

A garment is inspected against this sheet, so it has to be unambiguous. One row per measurement, one column per size, and a tolerance — this is the sheet that prevents a shipment being rejected over a 1 cm difference.

Field	What to put in it	Example
Points of measure	One row per point: chest width, body length, shoulder, sleeve, hem, cuff, hood opening, pocket placement.	Chest width
How each point is measured	One sentence per point, e.g. “chest width: 2.5 cm below the armhole, laid flat, edge to edge”.	2.5 cm below armhole, edge to edge
Size columns	XS to XXL, or the size set you actually sell. Add columns rather than approximating.	XS–XXL
Tolerance	The acceptable difference per point — ± 1 cm on knitwear is common. Without it nothing can be inspected.	± 1 cm
Unit	Centimetres are the factory standard. Inches are fine if the column is labelled.	cm
Sample vs bulk	Record which pattern version and sample round the sheet describes.	approved sample, round 2

Construction — how it is sewn

This sheet is where a good sample becomes a repeatable order. Describe the stitches, seams, thread and decoration exactly; anything left vague will be decided by whoever is on the machine.

Field	What to put in it	Example
Stitch type and density	For example single-needle lockstitch at 12 stitches per inch, overlock at 4–5 mm.	SNLS 12 SPI
Seam type and finish	Flatlock, overlock, taped shoulder-to-shoulder, French seams. A photo of a seam you like helps.	Taped shoulders
Thread	Thread type and colour: match the body or use a contrast.	Tex 30, match body
Print position and size	Placement, width $\times$ height, number of colours and the artwork file. Name the method if you care about it.	Front, 28 $\times$ 20 cm, 3 colours
Embroidery position and stitches	Placement, size and approximate stitch count per logo — stitch count is a cost driver.	Left chest, ~4,500 stitches
Hardware	Zipper type and length, drawcords, eyelets, snaps; colour and any test requirement.	YKK #5, nickel-free
Topstitching	Width and colour of visible stitching — a small detail that changes the look.	2 mm, tonal

Labels and packaging — what ships with it

Private label lives here: the trims and print that carry your brand, and the carton the goods arrive in.

Field	What to put in it	Example
Main label	Woven or printed, where it sits (usually centre back neck) and how it is attached.	Woven, centre back
Care label	Fibre content, care symbols and the languages your market requires.	EN/ES/FR, side seam
Hang tag	Size, material, attachment and whether a price is printed.	Matte card, black cord
Fold and polybag	How the garment is folded, bag type, size sticker and any suffocation warning.	Tissue wrap, recycled PE bag
Barcode or stickers	Your SKU barcode, EAN/UPC or retail-specific labels — send the files.	UPC-A
Carton packing	Pieces per carton, size and colour ratio, carton size and weight, shipping marks.	50 pcs, assorted sizes

Colorways — the colour plan

Colour is the most common cause of a bulk-fabric surprise. Name every colour, reference it to something physical and say how many pieces each one carries.

Field	What to put in it	Example
Colour name	The name you sell under. Keep it stable between sample and bulk.	Sea Green
Colour reference	Pantone TCX/TPX, a lab-dip reference or “match to sample”. Approve the lab dip before the dye lot.	Pantone 17-5117 TPX
Quantity per colour	How many pieces per colour. Below a fabric minimum, two colours may share a lot or carry a surcharge.	120 / 100 / 80
Size breakdown	How many of each size per colour — this sets fabric consumption and packing.	S–XXL, 20% / 30% / 30% / 20%
Trim matching	Which trims change colour with the body and which stay neutral.	Rib and drawcord tonal
Repeats and heroes	Say which colour is expected to sell and whether a reorder is planned; it helps fabric booking.	Sea Green is the hero
